## IONIC EQUILIBRIUM

$\star$ ELECTROLYTES : Compounds which dissociate into ions, when dissolved in water are called Electrolytes. e.g. $\mathrm{NaCl}, \mathrm{HCl}$, $\mathrm{CH}_{3} \mathrm{COOH}, \mathrm{H}_{2} \mathrm{O}$, etc.
$\star$ STRONG ELECTROLYTES : Compounds which get dissociated completely into ions in aqueous solution are called Strong electrolytes. e.g. Strong acids : $\mathrm{HCl}, \mathrm{HNO}_{3}, \mathrm{H}_{2} \mathrm{SO}_{4}$, and strong bases: $\mathrm{NaOH}, \mathrm{KOH}$, etc.
$\star$ WEAK ELECTROLYTES : Compounds which get ionized slightly into ions in aqueous solution are called Weak electrolytes.e.g.Weak acids : $\mathrm{CH}_{3} \mathrm{COOH}, \mathrm{HCN}, \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{OH}$ and Weak bases: $\mathrm{NH}_{3}, \mathrm{~N}_{2} \mathrm{H}_{4}, \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}$, etc.

## Que: Explain Self-Ionisation of water.

## Ans:

$\leadsto$ If sensitive Instrument is used, it is observed that water conducts electrical current to a small extent. Therefore water is a very WEAK ELECTROLYTE. This indicates that water is slightly dissociated into ions.
$\leadsto$ The formation of $\mathrm{H}^{+}{ }_{(\mathrm{aq})}$ and $\mathrm{OH}^{-}{ }_{(\mathrm{aq})}$ ions in small concentrations by the dissociation of water is called SELF - IONIZATION of water.
$\leadsto$ There exists an equilibrium between undissociated $\mathrm{H}_{2} \mathrm{O}_{(1)}$ molecules and ions $\left(\mathrm{H}^{+}{ }_{(\mathrm{aq})}\right.$ and $\left.\mathrm{OH}^{-}{ }_{(\mathrm{aq})}\right)$ formed due to dissociation. Thus,

$$
\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \rightleftharpoons \mathrm{H}_{(\mathrm{aq})}^{+} \text {and } \mathrm{OH}^{-}(\mathrm{aq})
$$

NOTE : The number of water molecules attached to $\mathrm{H}^{+}$is uncertain. Therefore hydrogen ion is represented by either $\mathrm{H}^{+}{ }_{(\mathrm{aq})}$ or $\mathrm{H}_{3} \mathrm{O}^{+}{ }_{(\mathrm{aq})}$.
Que : What is meant by Ionic Product of Water? Derive the equation for it.
[MARCH'99] (3 MARKS)
Ans:
$\leadsto$ Self-ionization of water can be represented as:

$$
\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \rightleftharpoons \mathrm{H}_{(\mathrm{aq})}^{+}+\mathrm{OH}_{(\mathrm{aq})}^{-}
$$

$\leadsto$ The equilibrium constant of this reaction is expressed as under :

$$
\mathrm{K}=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{H}_{2} \mathrm{O}\right]_{(\ell)}}
$$

$\rightarrow$ Suppose at $25^{\circ} \mathrm{C}$, 1 litre ( 1000 gms ) of water is taken,
$\rightarrow$ Concentration of water $=\frac{\text { No. of Molesof water }}{\text { Litreof Water }}=\frac{1000 \mathrm{gm} / 18 \mathrm{gm} / \mathrm{mole}}{1 \mathrm{~L}}=55.55 \mathrm{M}$
$\rightarrow$ Concentration of undissociated water $\left(\mathrm{H}_{2} \mathrm{O}_{(I)}\right)=55.55 \mathrm{M}$
 equal to original concentration ( $\mathrm{C}_{\mathrm{o}}$ )]

$$
\begin{equation*}
\therefore \mathrm{K}_{\mathrm{eq}} \times 55.55=\left[\mathrm{H}^{+}\right][\mathrm{OH}] \tag{1}
\end{equation*}
$$

$\rightarrow \mathrm{K}_{\mathrm{w}}$ is known as IONIC PRODUCT OF WATER. The value of $\mathrm{K}_{\mathrm{w}}$ at $25^{\circ} \mathrm{C}$ is $1 \times 10^{-14}$.
$\leadsto$ Self - ionization of water is an endothermic reaction, this increase in temperature of water shifts the equilibrium in the forward direction. Therefore, the concentrations of $\mathrm{H}^{+}{ }_{(\mathrm{aq})}$ and $\mathrm{OH}^{-}{ }_{(\mathrm{aq})}$ in water increase with the rise in temperature and hence $K_{w}$ increases with increase in temperature of water.
$\rightarrow \quad$ Now at $25^{\circ} \mathrm{C}$

$$
\begin{equation*}
K_{W}=1 \times 10^{-14} \tag{1}
\end{equation*}
$$

$$
\begin{aligned}
\therefore 1 \times 10^{-14}= & {\left[\mathrm{H}^{+}\right]^{2}=\left[\mathrm{OH}^{-}\right]^{2} } \\
& {\left[\because \mathrm{H}^{+}{ }_{(\text {aq })} \text { and } \mathrm{OH}^{-}{ }_{(\text {aq })} \text { are formed in } 1: 1\right. \text { mole }} \\
& \text { ratio due to self-ionization of water, }\left[\mathrm{H}^{+}\right]=\left[\mathrm{OH}^{]}\right] \\
& \text {in equation (1)] }
\end{aligned}
$$

$$
\therefore\left[\mathrm{H}^{+}\right]=[\mathrm{OH}]=1 \times 10^{-7} \mathrm{M}
$$

$\rightarrow$ Thus in pure water $\left[\mathrm{H}^{+}\right]=\left[\mathrm{OH}^{-}\right]$, hence pure water is neutral.
Que : Discuss the ionization of electrolytes in aqueous solutions.

## Ans:

$\rightarrow$ IONIZATION : The process of forming ions from molecules of compound in aqueous solution.
$\leadsto$ DEGREE OF IONIZATION : The fraction of dissolved compound ionized. e.g. 0.08 mole of a compound dissolved in water and 0.02
mole of it is ionized, the degree of ionization of the compound is $0.02 / 0.08=0.25$
[MARCH'97]

## $\rightarrow \quad$ Compounds producing ions in aqueous solutions are of two kinds

(1) IONIC SOLIDS :
$\rightarrow$ Compounds having ions as their constituents in solid state e.g. NaCl . Such compounds are known as Ionic solids. When such solids dissolve in water, ions are not formed but the ions which are held firmly in their positions in the lattice, of the compound are set free e.g.
$\mathrm{Na}^{+} \mathrm{Cl}^{-}{ }_{(\mathrm{s})} \longrightarrow \mathrm{Na}^{+}{ }_{(\mathrm{aq})}+\mathrm{Cl}^{-}{ }_{(\text {aq })}$
$\rightarrow$ Though ionic solids are completely ionized, their concentrated solutions contain some ion-pairs, e.g. $\mathrm{Na}^{+} \mathrm{Cl}^{-}$. Such ion pairs do not conduct electric current as they are electrically neutral.
$\rightarrow$ Thus two kinds of processes occur in concentrated aqueous solutions of strong electrolytes.
(i) A process producing ions capable of conducting electric current,
(ii) inspite of ionization process which has occurred in aqueous solution, a process of forming ion pairs incapable of conducting electric current.
$\rightarrow$ A process giving rise to ions capable of conducting electric current is described as 'DISSOCIATION'.
$\rightarrow$ A process which denotes the formation of ions capable and incapable (ion-pairs) of conducting electric current is described as 'IONIZATION'.

## $\rightarrow$ (2) POLAR COMPOUNDS :

$\rightarrow$ Some molecular compounds dissociated into ions, when they dissolve in water.
$\rightarrow$ Such compounds have polar bonds between parts producing positive ion and negative ion.
$\rightarrow$ This polar bond breaks in aqueous medium and the atom having higher electronegativity acquires one unit of negative charge and the atom having lower electronegativity acquires one unit of positive charge.

## IONIZATION OF WEAK ELECTROLYTES (ACIDS AND BASES)

$\leadsto$ Strong electrolytes like $\mathrm{HCl}, \mathrm{HNO}_{3}, \mathrm{NaOH}, \mathrm{KOH}$ ionize completely in their aqueous solutions.
$\leadsto$ Weak electrolytes like $\mathrm{CH}_{3} \mathrm{COOH}, \mathrm{NH}_{3}$ ionize slightly in their aqueous solutions. Therefore, there exists an equilibrium between ions and unionized molecules in aqueous solutions of weak electrolytes. This kind of ionization process is reversible and is shown by $\Longleftrightarrow$ sign in the equation e.g.

1. $\mathrm{CH}_{3} \mathrm{COOH}_{(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{O}_{(1)} \Leftrightarrow \mathrm{CH}_{3} \mathrm{COO}^{-}{ }_{(\mathrm{aq})}+\mathrm{H}_{3} \mathrm{O}^{+}{ }_{(\mathrm{aq})}$
2. $\mathrm{HCOOH}_{(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{O}_{(1)} \Leftrightarrow \mathrm{HCOO}^{-}{ }_{(\mathrm{aq})}+\mathrm{H}_{3} \mathrm{O}^{+}{ }_{\text {(aq) }}$
3. $\mathrm{ClCH}_{2} \mathrm{COOH}_{(\text {aq) }}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \Longleftrightarrow \mathrm{ClCH}_{2} \mathrm{COO}^{-}{ }_{\text {(aq) }}+\mathrm{H}_{3} \mathrm{O}^{+}{ }_{(\mathrm{aq})}$
4. $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CH}_{2} \mathrm{COOH}_{(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \Longleftrightarrow \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CH}_{2} \mathrm{COO}^{-}{ }_{(\text {aq) }}+\mathrm{H}_{3} \mathrm{O}^{+}{ }_{\text {(aq) }}$
5. $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{OH}_{(\text {aq) }}+\mathrm{H}_{2} \mathrm{O}_{(1)} \Longleftrightarrow \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}^{-}{ }_{(\mathrm{aq})}+\mathrm{H}_{3} \mathrm{O}^{+}{ }_{(\text {aq })}$
6. $\mathrm{HCN}_{(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \Longleftrightarrow \mathrm{CN}^{-}{ }_{(\text {aq) }}+\mathrm{H}_{3} \mathrm{O}^{+}{ }_{(\text {aq })}$
7. $\mathrm{NH}_{3(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{O}_{(1)} \Longleftrightarrow \mathrm{NH}_{4}^{+}{ }_{(\text {aq) }}+\mathrm{OH}^{-}{ }_{(\mathrm{aq})}$
8. $\mathrm{CH}_{3} \mathrm{NH}_{2}{ }_{(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \Longleftrightarrow \mathrm{CH}_{3} \mathrm{NH}_{3}{ }^{+}{ }_{(\mathrm{aq})}+\mathrm{OH}^{-}{ }_{(\text {aq })}$
9. $\left(\mathrm{CH}_{3}\right)_{2} \mathrm{NH}_{\text {(aq) }}+\mathrm{H}_{2} \mathrm{O}_{(1)} \Longleftrightarrow\left(\mathrm{CH}_{3}\right)_{2} \mathrm{NH}_{2}{ }^{+}{ }_{(\text {aq })}+\mathrm{OH}^{-}{ }_{\text {(aq) }}$
10. $\mathrm{N}_{2} \mathrm{H}_{4}{ }_{(\text {aq) }}+\mathrm{H}_{2} \mathrm{O}_{(1)} \Longleftrightarrow \mathrm{N}_{2} \mathrm{H}_{5}{ }^{+}{ }_{(\text {aq })}+\mathrm{OH}^{-}{ }_{\text {(aq) }}$
11. $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}{ }_{(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \Longleftrightarrow \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{3}{ }^{+}{ }_{(\mathrm{aq)}}+\mathrm{OH}^{-}{ }_{(\mathrm{aq})}$
12. $\left(\mathrm{C}_{6} \mathrm{H}_{5}\right)_{2} \mathrm{NH}_{(\text {aq) }}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \Longleftrightarrow\left(\mathrm{C}_{6} \mathrm{H}_{5}\right)_{2} \mathrm{NH}_{2}{ }^{+}{ }_{\text {(aq) }}+\mathrm{OH}^{-}{ }_{\text {(aq) }}$
$\leadsto$ The equilibrium constant of an equilibrium between ions of weak acid and unionized weak acid is expressed as $\mathrm{K}_{\mathrm{a}}$.
$\leadsto$ The equilibrium constant for weak base is denoted as $K_{b}$.
NOTE : $K_{a}=$ Ionization constant of an weak acid.
$K_{b}=$ Ionization constant of an weak base.
Que: Derive the equation for $K_{a}$ when weak acid is dissolved in water. OR
Derive the relation between $\mathrm{K}_{\mathrm{a}}$ (Ionization constant) and the concentration $\mathrm{C}_{0}$ of a Weak acid in water. [MARCH 96,97]
$\leadsto$ Following equilibrium exists in the aqueous solution of weak acid HA :

$$
\mathrm{HA}_{(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \Longleftrightarrow \mathrm{H}_{3} \mathrm{O}_{(\mathrm{aq})}^{+}+\mathrm{A}^{-}{ }_{(\mathrm{aq})}
$$

$\leadsto$ The equilibrium constant K of this equilibrium can be given by

$$
\begin{equation*}
K=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{A}^{-}\right]}{[\mathrm{HA}]\left[\mathrm{H}_{2} \mathrm{O}\right]_{(\ell)}} \tag{1}
\end{equation*}
$$

$\leadsto$ Here the decrease in concentration of water due to the dissolution of acid is negligible in comparison with the concentration of pure water. Therefore $\left[\mathrm{H}_{2} \mathrm{O}\right]$ in the above equation can be regarded as constant combining this constant concentration term with K , a new constant $\mathrm{K}_{\mathrm{a}}$ is written as under.

$$
\begin{equation*}
\mathrm{K}\left[\mathrm{H}_{2} \mathrm{O}\right]_{(\ell)}=\mathrm{K}_{\mathrm{a}}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{A}^{-}\right]}{[\mathrm{HA}]} \tag{2}
\end{equation*}
$$

$\rightarrow$ where $\mathrm{K}_{\mathrm{a}}$ is ionisation or dissociation constant of weak acid.
$\rightarrow$ As only slight amount of acid dissociates into ions in such solutions, the concentration of undissociated acid approximately equal to initial concentration $\mathrm{C}_{0}$ of the acid. Moreover, the concentrations of positive ions and negative ions are equal (neglecting $\mathrm{H}_{3} \mathrm{O}^{+}$produced by self - ionisation of water) i.e. $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\left[\mathrm{A}^{-}\right]$

$$
\begin{aligned}
& \therefore \mathrm{K}_{\mathrm{a}}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]}{\mathrm{C}_{\mathrm{O}}} \\
& \therefore \mathrm{~K}_{\mathrm{a}} \cdot \mathrm{C}_{0}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]^{2} \\
& \therefore\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\sqrt{\mathrm{K}_{\mathrm{a}} \cdot \mathrm{C}_{\mathrm{O}}}
\end{aligned}
$$

$\leadsto$ This formula indicates the concentration of $\mathrm{H}_{3} \mathrm{O}^{+}$produced by ionisation of weak acid.
Que : Derive the equation for $\mathrm{K}_{\mathrm{b}}$ when the weak base $\mathrm{NH}_{3}\left(\operatorname{or} \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{NH}_{2}\right.$, $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NH}_{2}, \mathrm{~N}_{2} \mathrm{H}_{4}, \mathrm{CH}_{3} \mathrm{NH}_{2}$ etc.) is dissolved in water.
OR

Derive the relation between the $\mathrm{K}_{\mathrm{b}}$ and the concentration $\mathrm{C}_{0}$ of the weak base $\left(\mathrm{NH}_{3}\right)$. [October 97] (3 marks)

## Ans:

$\leadsto$ Following equilibrium exists in the aqueous solution of weak base $\mathrm{NH}_{3}$

$$
\mathrm{NH}_{3(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{O}_{(1)} \Longleftrightarrow \mathrm{NH}_{4}^{+}{ }_{(\mathrm{aq})}+\mathrm{OH}^{-}{ }_{(\mathrm{aq})}
$$

$\leadsto$ The equilibrium constant :

$$
K=\frac{\left[\mathrm{NH}_{4}^{+}\right]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{NH}_{3}\right]\left[\mathrm{H}_{2} \mathrm{O}\right]_{(\ell)}}
$$

$\leadsto$ Here the decrease in concentration of water due to the dissolution of base is negligible in comparison with the concentration of pure water. Therefore, $\left[\mathrm{H}_{2} \mathrm{O}\right]_{(1)}$ in the above equation is regarded constant. Combining this constant concentration term with K , a new constant $K_{b}$ is,

$$
\mathrm{K}\left[\mathrm{H}_{2} \mathrm{O}\right]_{(\ell)}=\mathrm{K}_{\mathrm{b}}=\frac{\left[\mathrm{NH}_{4}^{+}\right]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{NH}_{3}\right]}
$$

$\rightarrow$ where $\mathrm{K}_{\mathrm{b}}$ is ionisation constant or dissociation constant of weak acid.
$\leadsto$ As weak base $\left[\mathrm{NH}_{3}\right]$ ionizes slightly in such solutions, the concentration of unionized base in aqueous solution is nearly equal to the initial concentration $\mathrm{C}_{\mathrm{O}}$.Moreover $\left[\mathrm{NH}_{4}{ }^{+}\right]=[\mathrm{OH}]$, as the concentration of $\mathrm{OH}^{-}$produced by self-ionization of water is negligible.

$$
\begin{aligned}
& \mathrm{K}_{\mathrm{b}}=\frac{\left[\mathrm{OH}^{-}\right]\left[\mathrm{OH}^{-}\right]}{\mathrm{C}_{\mathrm{O}}} \\
& \therefore \mathrm{~K}_{\mathrm{b}} \cdot \mathrm{C}_{\mathrm{o}}=\left[\mathrm{OH}^{-}\right]^{2} \\
& \therefore\left[\mathrm{OH}^{-}\right]=\sqrt{\mathrm{K}_{\mathrm{b}} \cdot \mathrm{C}_{\mathrm{O}}}
\end{aligned}
$$

$\leadsto$ This formula indicates $\left[\mathrm{OH}^{7}\right]$ produced by ionization of weak base.
Que: Derive the equation of ionization constant for the aqueous solution of dimethyl amine.
[October 98] (3 marks)
$\leadsto$ Importance of $K_{a} \& K_{b}$ :
$\leadsto$ Higher the value of $K_{a}$, stronger the acid.
$\leadsto$ Higher the value of $K_{b}$, stronger the base.
Que: Write a note on pH scale.
$\leadsto$ Sorenson devised a new scale to express concentration of $\mathrm{H}^{+}$(aq) in aqueous solution. This new scale is known as pH scale.
$\xrightarrow{\rightarrow} \mathrm{pH}$ scale :
$\rightarrow$ Definition : "Negative logarithm of the molarity of the $\mathrm{H}_{3} \mathrm{O}^{+}$ion in aqueous solution is called pH .

$$
\begin{equation*}
\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{+}\right] \tag{4}
\end{equation*}
$$

$\rightarrow$ Definition : "Negative logarithm of the molarity of the $\mathrm{OH}^{-}$ion in aqueous solution is called pOH .

$$
\mathrm{pOH}=-\log [O H]
$$

$\longrightarrow$ If the concentration of $\mathrm{H}_{3} \mathrm{O}^{+}$in solution decreases, pH of the solution increases.
$\leadsto$ Values of pH and pOH at $25^{\circ} \mathrm{C}$
$\rightarrow$ 1. For pure water: $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]=\left[\mathrm{OH}^{\top}\right]=1 \times 10^{-7} \mathrm{M}$ $\mathrm{pH}=\mathrm{pOH}=-\log \left(1 \times 10^{-7}\right)=7.0$
$\rightarrow$ 2. For acidic solutions: $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]>1 \times 10^{-7} \mathrm{M} \&[\mathrm{OH}]<10^{-7} \mathrm{M}$ $\mathrm{pH}<7$ \& $\mathrm{pOH}>7$
$\rightarrow$ 3. For basic solutions: $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]<1 \times 10^{-7} \mathrm{M} \&[\mathrm{OH}]>10^{-7} \mathrm{M}$ $\mathrm{pH}>7 \& \mathrm{pOH}<7$
$\rightarrow$ 4. For any aqueous solution: $\mathrm{pH}+\mathrm{pOH}=14$ pH scale can be represented as under :
$\longleftarrow$ Acidity Increases $\longrightarrow$ Basicity Increases $\longrightarrow$

## $\star \star$ DETERMINATION (CALCULATION) OF $\mathrm{pH}:$

$\leadsto$ In the aqueous solution of strong acid, concentration of strong acid is equal to the concentration of $\mathrm{H}_{3} \mathrm{O}^{+}$in solution. Hence pH value can be calculated directly from the concentration of strong acid.
$\leadsto$ In the aqueous solution of strong base, concentration of strong base is equal to the concentration of $\mathrm{OH}^{-}$in the solution. Hence pOH value can be calculated directly from the concentration of strong base. From this pH can be calculated.
$\leadsto$ From the concentration of weak acid, and its $K_{a}$ value, molar concentration of $\mathrm{H}_{3} \mathrm{O}^{+}$can be calculated which is used to calculate pH value.
$\leadsto$ From the concentration of weak base, and its $K_{b}$ value, molar concentration of $\mathrm{OH}^{-}$can be calculated, which is used to calculate pOH and thereby pH can be calculated.
$\leadsto \mathrm{pH}$ can be measured accurately by pH meter.
$\leadsto$ Approximate value of pH of solution can be determined by using pH paper of indicator.
$\star \star \mathrm{pH}$ OF CONCENTRATED SOLUTION :
$\leadsto$ Usually pH values of most of solutions are in the range 1-14.
$\leadsto$ However, if $\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]$is less than $0.1 \mathrm{M}, \mathrm{pH}$ would be less than one e.g. pH of 1 M HCl solution is near to zero and pH of 2 M HCl is less than zero. So pH is not generally useful to express concentration of concentrated solution.
$\leadsto$ In concentrated solution neutral solution neutral ion - pairs are formed. Morever, there is proximity of ions. Hence concentrated solution behave non - ideally.
$\rightarrow$ As a result the actual concentration of $\mathrm{H}_{3} \mathrm{O}^{+}$in solution having high molarity cannot be calculated on the basis of molarity of solution. Hence correct pH values of concentrated solution are not obtained.

## USEFULNESS OF pH :

1. pH scale magnifies small values of concentration of $\mathrm{H}_{3} \mathrm{O}^{+}$.
2. The extent of acid - base titration can be demonstrated graphically by using pH scale.
3. The useful pH range of acid - base indicator can be explained using pH scale.

Que : Write the operational definition of an acid and a base. (Robert Boyle theory)

Ans:

## $\leadsto$ An Acid 1. is sour in taste. <br> 2. Turns blue litmus red.

3. Is neutralised by alkali. 4 . Evolves $\mathrm{H}_{2(\mathrm{~g})}$ when reacts with metals.
$\leadsto$ A Base 1. Is bitter in taste. 2. Turns red litmus blue.
4. Is neutralised by acid.

Que : Discuss different theories put forward to explain acid - base reactions.
$\star \star$ 1. ARRHENIUS THEORY OF ACID - BASE : (1880-1890)
$\leadsto$ Definition : The substance which produce $\mathrm{H}^{+}$when dissolved in water is acid and the substance which produce $\mathrm{OH}^{-}$when dissolved in water is base.
$\leadsto$ He attributed properties of acids to $\mathrm{H}^{+}$and properties of bases to $\mathrm{OH}^{-}$
$\rightarrow$ It was believed that these compounds dissociated reversibly into ions in aqueous solutions and therefore, their aqueous solutions showed electrical conductivity and chemical reactivity.
$\leadsto$ Limitations : [Q. Give reasons - Arrhenius theory of acid-base has met some difficulties] [MARCH 99] (1.5 Marks)
$\rightarrow$ 1. This theory does not explain the form of $\mathbf{H}^{+}$(proton) in aqueous solutions.
$\rightarrow$ 2. Some compounds do not have hydroxyl ions $\left(\mathrm{OH}^{-}\right)$in the formulae; yet they behave like as base. e.g. $\mathrm{NH}_{3(\mathrm{~g})}$, behaves like a base in its reaction with $\mathrm{HCl}_{(\mathrm{g})}$. Similarly $\mathrm{Na}_{2} \mathrm{CO}_{3}$ does not have $\mathrm{OH}^{-}$but behaves as base.
$\rightarrow \quad 3$. This theory does not explain the role of water.
$\leadsto$ Usefulness : This theory is useful to compare relative strengths of different acids and bases.

Que : Write Lowry - Bronsted theory of Acids and Bases, explain giving two examples and write a note on conjugate acid and conjugate base.
(March 98)
Ans:
LOWRY BRONSTED THEORY OF ACIDS AND BASES (1925) :
$\leadsto$ Definition : "Acids were compound which donated protons and bases were compound which accepted protons during reactions".
$\rightarrow$ According to this definition, an acid-base reaction is a process in which proton transfer occurs, e.g.

| Proton Donor | Proton Acceptor |  |  | Proton Donor |  | Proton Acceptor |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{HCl}_{\text {(aq) }}$ | + | $\mathrm{H}_{2} \mathrm{O}_{(1)}$ | $\Longleftrightarrow$ | $\mathrm{H}_{3} \mathrm{O}^{+}{ }_{\text {(aq) }}$ | + | $\mathrm{Cl}^{-}{ }_{\text {(aq) }}$ |
| $\mathrm{CH}_{3} \mathrm{COOH}_{(\text {(aq) }}$ | + | $\mathrm{H}_{2} \mathrm{O}_{(1)}$ | $\Longleftrightarrow$ | $\mathrm{H}_{3} \mathrm{O}^{+}$(aq) | + | $\mathrm{CH}_{3} \mathrm{COO}^{-}{ }_{\text {(aq) }}$ |
| $\mathrm{HNO}_{3(1)}$ | + | $\mathrm{H}_{2} \mathrm{O}_{(1)}$ | $\Leftrightarrow$ | $\mathrm{NO}_{3}^{-}{ }_{\text {(aq) }}$ | + | $\mathrm{H}_{3} \mathrm{O}^{+}{ }_{\text {aq) }}$ |
| $\mathrm{H}_{2} \mathrm{SO}_{4(\mathrm{I})}$ | + | $2 \mathrm{H}_{2} \mathrm{O}_{(1)}$ | $\Longleftrightarrow$ | $\mathrm{SO}_{4}^{-2}{ }_{\text {(aq) }}$ | + | $2 \mathrm{H}_{3} \mathrm{O}^{+}{ }_{\text {aq) }}$ |
| $\mathrm{H}_{2} \mathrm{O}_{(1)}$ | + | $\mathrm{H}_{2} \mathrm{O}_{(1)}$ | $\Longleftrightarrow$ | $\mathrm{H}_{3} \mathrm{O}^{+}{ }_{\text {(aq) }}$ | + | $\mathrm{OH}^{-}$(aq) |
| $\mathrm{H}_{2} \mathrm{O}_{(1)}$ | + | $\mathrm{NH}_{3(\mathrm{~g})}$ | $\Longleftrightarrow$ | $\mathrm{OH}^{-}$(aq) | + | $\mathrm{NH}_{4}{ }^{+}(\mathrm{aq})$ |

$\leadsto$ From above illustrations it can be said that a reaction between acid and base produce a base and a acid.
$\leadsto$ An acid produces conjugate base by giving up proton and a base produces a conjugate acid by gaining a proton.
$\rightarrow \quad$ i.e. Any Acid $-\mathrm{H}^{+}=$conjugate base \& base $+\mathrm{H}^{+}=$conjugate acid.
$\star \star$ CONJUGATE ACID - BASE : [MARCH 96, 98, OCTOBER 96, 97]
$\rightarrow$ "The pair of acid-base having difference of one proton is known as conjugate acid-base."
$\leadsto$ According to this theory :
$\rightarrow$ 1. Strong acid has high tendency to give up proton so its conjugate base will be weak.
$\rightarrow$ 2. Strong base has high tendency to accept proton, so its conjugate acid will be weak.

[Q. Complete | $\mathrm{H}_{3} \mathrm{ASO}_{4}+2 \mathrm{H}_{2} \mathrm{O}(1) \Longleftrightarrow \quad$ (Acid-1) |
| :--- |

$\rightarrow$ This theory helps us
$\rightarrow$ 1. To measure the strength of different acids i.e. tendency to donate protons, water is selected as a base. On the basis of this quantitative expression of tendency to loose proton by acid is given by $K_{a}$ value.
$\rightarrow$ 2. To measure the strength of different acids i.e. tendency to accept protons, water is selected as a base. On the basis of this quantitative expression of tendency to accept proton by base is given by $\mathbf{K}_{\mathbf{b}}$ value.

## $\leadsto$ Limitations :

$\rightarrow$ 1. According to this theory, proton transfer is essential, otherwise reaction is not considered as acid-base reaction. But in fact there are some acid - base reaction in which proton transfer does not take place e.g. $\mathrm{BF}_{3}+\mathrm{F}^{-} \longrightarrow \mathrm{BF}_{4}{ }^{-}$

Acid Base
$\rightarrow$ 2. This theory does not cover the reactions taking place in absence of solvent.
$\star \star$ LEWIS THEORY OF ACID - BASE : (1923)
$\leadsto$ Definition : 'Acid is a compound which accept electron pair during reaction and base is a compound which donates and electron pair during reactions'.
e.g.

| Acid | Base |
| ---: | :--- |
| $\mathrm{Ag}^{+}{ }_{(\mathrm{aq})}+2 \mathrm{NH}_{3(\mathrm{aq)}}$ | $\Longleftrightarrow \mathrm{Ag}\left(\mathrm{NH}_{3}\right)_{2}^{+}{ }_{(\mathrm{aq})}$ |
| $\mathrm{BF}_{3}+\mathrm{F}^{-}$ | $\Longleftrightarrow \mathrm{BF}_{4}^{-}$ |
| $\mathrm{BF}_{3}+\mathrm{NH}_{3}$ | $\Longleftrightarrow \mathrm{~F}_{3} \mathrm{~B} \longleftarrow \mathrm{NH}_{3}$ |
| $\mathrm{Ag}^{+}{ }_{\text {(aq) }}+2 \mathrm{CN}^{-}+(\mathrm{aq)}$ | $\Longleftrightarrow \mathrm{Ag}(\mathrm{CN})_{2}^{-}{ }_{\text {(aq) }}$ |

$\rightarrow$ In above reactions, $\mathrm{NH}_{3}, \mathrm{~F}^{-}$and $\mathrm{CN}^{-}$donate electron pair hence they are Lewis base while $\mathrm{Ag}^{+}$and $\mathrm{BF}_{3}$ accept electron pair hence they are Lewis acids.
$\rightarrow$ Thus reactant acting as Lewis acid may be cation or electron deficient molecule (e.g. $\mathrm{Ag}^{+}, \mathrm{Cu}^{+2}, \mathrm{BF}_{3}$ ) and a reactant act as a lewis base may be anion or a molecule having non-bonding electron-pair with the atom (e.g. $\mathrm{NH}_{3}, \mathrm{~F}^{-}, \mathrm{CN}^{-}, \mathrm{OH}^{-}, \mathrm{Cl}^{-}, \mathrm{NH}_{2}^{-}$)
[October 98]

## $\star \star$ ILLUSTRATION OF LEWIS ACID - BASE REACTION : (Explain Hydration) [October 98] (2 Marks)

$\rightarrow 1$. When salt is dissolved in water, ions formed in solution become hydrated. This process of hydration is an acid - base reaction. e.g. Lewis acid base reaction between $\mathrm{Na}^{+}$and $\mathrm{H}_{2} \mathrm{O}$ as under :
$\leadsto 2$. Ions and molecules acting as ligands in the formation of complex salts are Lewis Bases and metal ions bonding to ligands in the formation of complex salts are Lewis Acids.

## $\star \star$ REASONING :

$\leadsto$ Lowry Bronsted bases are Lewis bases, Lowry Bronsted acids are Lewis acids.
$\rightarrow$ All Lewis bases donate electron pair and owing to non-bonding electron pair Lewis bases can accept proton, hence can be considered as Lowry bronsted base. e.g. $\mathrm{NH}_{3}, \mathrm{Cl}^{-}, \mathrm{OH}^{-}$etc. are Lewis bases as well as Lowry Bronsted bases.
$\leadsto$ Lewis acids accept electron pair during reaction. But some of those cannot donate proton, hence cannot be considered as Lowry Bronsted acids e.g. $\mathrm{H}_{2} \mathrm{O}, \mathrm{BF}_{3}, \mathrm{Ag}^{+}$etc accept electron pair, hence they are Lewis acid, but $\mathrm{BF}_{3}$ and $\mathrm{Ag}^{+}$cannot donate protons, hence they are not Lowry - Bronsted acid.
$\longrightarrow$ Thus, all Lowry - Bronsted bases are Lewis bases and all Lowry Bronsted acids are Lewis acids but all Lewis acids are not Lowry - Bronsted acids.

Que: Write a note on Acid - base titrations and pH scale.
[March 98] (3 marks)
Ans:
$\leadsto$ A titration is one of the experimental methods used in laboratories to determines the concentrations of one solution (unknown) from the known concentration of other solution (using $N_{1} V_{1}=N_{2} V_{2}$ )
$\leadsto$ In acid - base titrations, a definite volume of solution (acid or base) is taken in pipette which is completely neutralised with other solution (base or acid) of burette.
$\leadsto$ In order to detect the stage at which the reaction is completed two or three drops of a solution of a third reagent capable of changing its colour in the process of neutralisation, called indicator.
$\leadsto$ By knowing volume of second solution, the unknown concentration of solution can be calculated.
$\leadsto$ During acid-base titration, change in pH of the solution is very. slow in the starting of reaction. But pH undergoes a large change during last stage. On the basis of large change in pH , indicator is selected in acid-base titration which can be explained as under :

| Volume of Solution <br> of NaOH added <br> from burette | Percentage of <br> neutralization | pH of solution of HCI <br> taken in pipette |
| :---: | :---: | :---: |
| 0.0 ml | $0 \%$ | 1 |
| 5.0 ml | $50 \%$ | 1.4 |
| 9.9 ml | $99.99 \%$ | 4.3 |
| 10.0 ml | $100.00 \%$ | 7.00 (Complete neutralization) |
| 10.1 ml | $100.10 \%$ | 10.7 |

$\leadsto$ Thus, pH changes very rapidly from 4.3 to 10.70 during $99.9 \%$ 100.1 \% titration stage (phenolphthalein can be used as an indicator because useful pH range of phenolphthalein is $8-10$ )
$\leadsto$ This range of pH decreases, if the concentration of HCl is less than 0.1 M . Therefore, it is essential to have certain minimum concentrations of solutions used in titration; too dilute solutions cannot be titrated successfully.
[Q.What is the change in the value of pH during 99.9\%-100\% acid - base titration stage]
[October 98] (1 mark)
Que: Write a note on : HYDROLYSIS OF SALTS in aqueous solutions.
Ans:
$\leadsto$ Aqueous solution of salts are either ACIDIC, BASIC OR NEUTRAL.

|  | SALT | SOLUTION | ILLUSTRATION |
| :---: | :--- | :--- | :--- |
| 1 | Strong acid - strong base | Neutral | $\mathrm{KNO}_{3}, \mathrm{Na}_{2} \mathrm{SO}_{4}, \mathrm{KCl}$ |
| 2 | Strong acid - weak base | Acidic | $\mathrm{CuSO}_{4}, \mathrm{NH}_{4} \mathrm{Cl}, \mathrm{FeCl}$ |
| 3 | Weak acid - strong base | Basic | $\mathrm{Na}_{2} \mathrm{CO}_{3}, \mathrm{~K}_{3} \mathrm{PO}_{3}, \mathrm{CH}_{3} \mathrm{COONa}$ |
| 4 | Weak acid - weak base | Netural | $\mathrm{HCOONH}_{4},\left(\mathrm{CH}_{3} \mathrm{COO}\right)_{3} \mathrm{Al}$ |

$\leadsto$ HYDROLYSIS : lons formed from salts react with ions $\left(\mathrm{H}^{+}{ }_{(\mathrm{aq})}\right.$ or $\mathrm{OH}^{-}(\mathrm{aq})$ ) produced from water, reaction is called hydrolysis.

## $\rightarrow$ 1. Hydrolysis of salt of strong base - weak acid ( $\mathrm{CH}_{3} \mathrm{COONa}$ )

Suppose salt MA produced by a reaction between a strong base $(\mathrm{MOH})$ and a weak acid $(\mathrm{HA})$ is dissolved in water.

The following equilibrium exists in water.

$$
\mathrm{H}_{2} \mathrm{O}_{(1)} \Longleftrightarrow \mathrm{H}^{+}{ }_{(\mathrm{aq})}+\mathrm{OH}^{-}{ }_{\text {(aq) }}
$$

Salt MA ionise completely in aqueous solution :

$$
M A \Longleftrightarrow M^{+}+A^{-}
$$

$\rightarrow \quad$ Now salt MA reacts with $\mathrm{H}_{2} \mathrm{O}$ as under :

$$
\begin{gathered}
\mathrm{MA}+\mathrm{H}_{2} \mathrm{O}_{(1)} \Longleftrightarrow \mathrm{MOH}+\mathrm{HA} \\
\text { salt } \\
\mathrm{M}_{(\mathrm{aq})}^{+}+\mathrm{A}_{(\mathrm{aq})}^{-}+\mathrm{H}_{2} \mathrm{O}_{(1)}
\end{gathered} \stackrel{\text { strong Base }}{ } \Longleftrightarrow \mathrm{M}_{(\mathrm{aq})}^{+}+\mathrm{OH}_{\text {(aq) }}^{-} \mathrm{HA}
$$

(Removing spectator ions)

$$
\mathrm{A}_{\text {(aq) }}^{-}+\mathrm{H}_{2} \mathrm{O}_{(1)} \Longleftrightarrow \mathrm{HA}_{(\mathrm{aq)}}+\mathrm{OH}^{-}(\mathrm{aq)}
$$

$\rightarrow$ As HA is weak acid, it ionises slightly. Therefore, the concentration of A present along with $\mathrm{H}^{+}$would be very low. When salt dissolves in water $A^{-}$ions are formed in large concentration. As a result, they combine with $\mathrm{H}^{+}$ions produced by self - ionization of water and form undissociated HA. This disturbs the equilibrium in water. As a result, according to Le chateliers's principle, the equilibrium of water shifts in the forward direction and produces more $\mathrm{H}^{+}$and $\mathrm{OH}^{-}$ions. However, as $\mathrm{H}^{+}$are removed by $\mathrm{A}^{-}$, the concentration of $\mathrm{OH}^{-}$ions exceeds the concentration of $\mathrm{H}^{+}$ions in the new state of equilibrium and therefore solution becomes basic.
[Q. An aqueous solution of sodium formate is basic] (March 97) (2 marks)
$\rightarrow$ 2. HYDROLYSIS OF strong acid (HA) and weak base (MOH) $\left(\mathrm{NH}_{4} \mathrm{Cl}\right)$
$\rightarrow$ Suppose salt MA is produced by reaction between strong acid (HA) and weak base ( MOH ) dissolved in water.
$\rightarrow$ The following equilibrium exists in water $\mathrm{H}_{2} \mathrm{O}_{(\mathrm{I})} \Longleftrightarrow \mathrm{H}_{(\mathrm{aq})}^{+}+\mathrm{OH}_{(\mathrm{aq})}^{-}$
$\rightarrow$ Salt MA ionize completely in water (aqueous solution) $M A \Longleftrightarrow M^{+}+A_{(a q)}^{-}$
$\rightarrow \quad$ Now salt MA reacts with water $\left(\mathrm{H}_{2} \mathrm{O}_{(1)}\right)$ as under

$$
\begin{aligned}
& \mathrm{MA} \\
& \text { Salt } \\
& \mathrm{H}_{2} \mathrm{O}_{(1)} \text { Water }
\end{aligned} \underset{\text { WeakBase }}{\mathrm{H}^{2}} \mathrm{MOH}+\underset{\text { StrongAcid }}{\mathrm{HA}}
$$

$$
\mathrm{M}_{(\mathrm{aq})}^{+}+\mathrm{A}_{(\mathrm{aq})}^{-}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \Longleftrightarrow \mathrm{MOH}+\mathrm{H}^{+}{ }_{(\mathrm{aq})}+\mathrm{A}_{(\mathrm{aq)})}^{-}
$$

(Removing spectator ions)

$$
\mathrm{M}_{(\mathrm{aq})}^{+}+\mathrm{H}_{2} \mathrm{O}_{(1)} \Longleftrightarrow \mathrm{MOH}+\mathrm{OH}^{-}{ }_{(\mathrm{aq})}
$$

$\rightarrow$ As MOH is weak base, it ionizes slightly. The concentration of $\mathrm{M}^{+}$ present along with $\mathrm{OH}^{-}$would be very low. When salt dissolves in water $\mathrm{M}^{+}$are formed in large concentration which combines with $\mathrm{OH}^{-}$to give MOH (undissociated). This reaction disturbs the equilibrium in water. When the net reaction reaches new state of equilibrium, the concentration of $\mathrm{H}^{+}$exceeds the concentration $\mathrm{OH}^{-}$and the solution becomes acidic.
[Q.Write the effect of aqueous solution of $\mathrm{CaCl}_{2}$ on litmus paper] (Oct 98)
OR
[Q.An aqueous solution of $\mathrm{FeCl}_{3}$ is acidic.] [Oct 96] (1.5 marks)
$\rightarrow$ HYDROLYSIS CONSTANT $\left(K_{h}\right)$ : The equilibrium constant of hydrolysis reaction is known as hydrolysis constant $\left(\mathrm{K}_{\mathrm{h}}\right)$.

1. For the salt formed from strong base and weak acid,

$$
\begin{aligned}
\mathrm{K}_{\mathrm{h}}=\frac{\mathrm{K}_{\mathrm{w}}}{\mathrm{~K}_{\mathrm{a}}} \text { where, } \mathrm{K}_{\mathrm{a}} & =\text { ionization constant of acid \& } \\
\mathrm{K}_{\mathrm{w}} & =\text { ionic product of water. }
\end{aligned}
$$

2. For salt formed from strong acid and weak base,

$$
K_{h}=\frac{K_{w}}{K_{b}}
$$

where, $\mathrm{K}_{\mathrm{b}}=$ ionization constant of acid \&

$$
K_{w}=\text { ionic product of water. }
$$

Que : Explain and illustrate solubility product. [March 97] (2 marks)

## Ans:

$\leadsto$ SPARINGLY SOLUBLE SALTS : Salts which form aqueous saturated solution, having less than 0.01 M concentration are called sparingly soluble salts.
[Oct. 96, March 98] (1mark)
$\leadsto$ If a saturated solution of such salts is in contact with a solid salt, there exists an equilibrium between the solid salt and its ions in the solution.

$$
\mathrm{MA}_{(\mathrm{s})} \Longleftrightarrow \mathrm{M}^{+}{ }_{(\mathrm{aq})}+\mathrm{A}_{(\mathrm{aq})}^{-}
$$

$\leadsto$ Now as the concentration of saturated solution of sparingly soluble salt is low, there is no possibility of presence of undissociated salt in the solution.

## $\leadsto$ DERIVATION OF SOLUBILITY PRODUCT OF SPARINGLY

 SOLUBLE SALTS ( $\mathrm{K}_{\mathrm{sp}}$ ):$\rightarrow$ Let MA be the sparingly soluble salt.

$$
\begin{aligned}
& \mathrm{MA}_{(\mathrm{s})} \Longleftrightarrow \mathrm{M}_{(\mathrm{aq)}}^{+}+\mathrm{A}_{(\mathrm{aq})}^{-} \\
& \mathrm{K}=\frac{\left[\mathrm{M}^{+}\right]\left[\mathrm{A}^{-}\right]}{[\mathrm{MA}]_{(\mathrm{s})}} \\
& \therefore \mathrm{K}_{(\mathrm{sp})}=\left[\mathrm{M}^{+}\right]\left[\mathrm{A}^{-}\right]
\end{aligned}
$$

eg.

1. $\mathrm{AgCl}_{(\mathrm{s})} \Longleftrightarrow \mathrm{Ag}^{+}{ }_{(\mathrm{aq})}+\mathrm{Cl}^{-}{ }_{(\mathrm{aq})}$

$$
\begin{aligned}
& K=\frac{\left[\mathrm{Ag}^{+}\right]\left[\mathrm{Cl}^{-}\right]}{\left[\mathrm{AgCl}_{(\mathrm{s})}\right.} \quad \therefore \mathrm{K} \cdot[\mathrm{AgCl}]_{(\mathrm{s})}=\left[\mathrm{Ag}^{+}\right]\left[\mathrm{Cl}^{-}\right] \\
& \therefore \mathrm{K}_{(\mathrm{sp})}=\left[\mathrm{Ag}^{+}\right]\left[\mathrm{Cl}^{-}\right]
\end{aligned}
$$

2. $\mathrm{CaF}_{2(\mathrm{~s})} \Longleftrightarrow \mathrm{Ca}^{+2}{ }_{\text {(aq) }}+\mathrm{A}_{\text {(aq) }}^{-}$

$$
\begin{aligned}
& K=\frac{\left[\mathrm{Ca}^{2+}\right]\left[\mathrm{F}^{-}\right]^{2}}{\left[\mathrm{CaF}_{2}\right]_{(\mathrm{s})}} \quad \therefore \mathrm{K} \cdot\left[\mathrm{CaF}_{2}\right]_{(\mathrm{s})}=\left[\mathrm{Ca}^{2+}\right]\left[\mathrm{F}^{-}\right]^{2} \\
\therefore & K_{(\mathrm{sp})}=\left[\mathrm{Ca}^{2+}\right]\left[\mathrm{F}^{-}\right]^{2}
\end{aligned}
$$

## $\leadsto$ SIGNIFICANCE OF K ${ }_{\mathrm{sp}}$ :

[March 98] (1 mark)
$\rightarrow$ (i) From the value of $\mathrm{K}_{\mathrm{sp}}$, the condition necessary for quantitative precipitation of positive ion of the salt from its solution can be attained.
$\rightarrow$ (ii) From the value of $K_{s p}$, the solubility of sparingly soluble salt can be known.
$\rightarrow$ (iii) From the value of $\mathrm{K}_{\mathrm{sp}}$ of different salts having similar formula, their solubility can be compared.
$\leadsto$ EXPERIMENTAL INFORMATION ABOUT SOLUBILITY OF SALT :
$\rightarrow \quad$ 1. All salts of $\mathrm{Na}^{+}, \mathrm{K}^{+}$and $\mathrm{NH}_{4}^{+}$, are soluble in water.
$\rightarrow \quad 2$. All nitrates are soluble in water.
$\rightarrow$ 3. All compounds formed by bonding of inorganic negative ion with $\mathrm{H}^{+}$are soluble in water.
$\rightarrow$ 4. All sulphates, except $\mathrm{PbSO}_{4}, \mathrm{CaSO}_{4}$, and $\mathrm{BaSO}_{4}$, and $\mathrm{SrSO}_{4}$, are soluble in water.
$\rightarrow \quad$ 5. All chlorides, except $\mathrm{AgCl}, \mathrm{HgCl}_{2}$ and $\mathrm{CuCl}_{2}$ are soluble in water.
$\rightarrow$ 6. Sulphides of alkali metals and alkaline earth metals are soluble in water. Sulphides of other metals (heavy) are sparingly soluble in water.
$\rightarrow$ 7. Hydroxides of alkali metals, barium and radium are water soluble.
$\rightarrow$ 8. Carbonates, phosphates and sulphates of alkali metals and radium are water - soluble.

## Que : Explain and illustrate : Common ion effect.

[October 96] (3 marks)

## Ans:

$\leadsto$ An equilibrium exists between undissociated molecules of weak electrolytes and its ions, if the electrolyte is dissolved in water. Similarly, if a saturated solution of a salt is in contact with the solid salt, an ionic equilibrium between the solid salt and its ions in the solution exist.
$\leadsto$ If another electrolyte having one of the ions the same are present in the solution, is added to the saturated solution, the equilibrium in the solution gets disturbed.
$\leadsto$ According to the Le - chatelier's principle, the reverse process is favoured to reach the new state of equilibrium. This effect is known as COMMON ION EFFECT.
e.g.

1. The following equilibrium exists in aqueous solution of $\mathrm{CH}_{3} \mathrm{COOH}$.
$\mathrm{CH}_{3} \mathrm{COOH}_{\text {(aq) }} \Longleftrightarrow \mathrm{CH}_{3} \mathrm{COO}_{\text {(aq) }}^{-}+\mathrm{H}^{+}{ }_{\text {(aq) }} \quad$ (Weak electrolyte)
$\leadsto$ If $\mathrm{CH}_{3} \mathrm{COONa}$ is added to this solution, the concentration of $\mathrm{CH}_{3} \mathrm{COO}^{-}$ ion increases, as $\mathrm{CH}_{3} \mathrm{COONa}$ is a strong electrolyte. This distrurbs the above equilibrium. i.e.

$\rightarrow$ To reach again the state of equilibrium some $\mathrm{CH}_{3} \mathrm{COO}^{-}$ions combine with $\mathrm{H}^{+}$ions and produce undissociated $\mathrm{CH}_{3} \mathrm{COOH}$. This effect is called Common ion effect.
$\rightarrow$ If a small amount of HCl is added to the solution, the addit ion of common ion $\mathrm{H}^{+}$shifts the equilibrium in the reverse direction as under:

2. The following equilibrium exists in saturated solution of AgCl (Sparingly soluble salt)

$\leadsto$ Addition of small quantity of $\mathrm{NaCl}_{(\mathrm{s})}$ to this solution increases the concentration of $\mathrm{Cl}^{-}{ }_{(\mathrm{aq})}$. Therefore, some of $\mathrm{Cl}^{-}$combine with $\mathrm{Ag}^{+}{ }_{(\mathrm{aq})}$ (Le - Chatlier's Principle) and precipitate AgCl . Thus due to common ion $\left(\mathrm{Cl}^{-}\right)$effect, solubility of AgCl decreases.
$\rightarrow$ If $\mathrm{HCl}_{(\mathrm{g})}$ is passed through saturated solution of NaCl the concentration of $\mathrm{Cl}^{-}{ }_{\text {(aq) }}$ increases (Common ion effect). This result in the precipitation of $\mathrm{NaCl}_{(\mathrm{s})}$ i.e.
[March 96] (2 marks)

## Que : Explain application of Common ion effect.

Ans:
$\longrightarrow$ (i) Useful in qualitative analysis.
$\leadsto$ (ii) To precipitate or to decrease the solubility of salt (as discussed above). e.g.
$\leadsto 1$. Precipitation of $\mathrm{Cu}^{+2}$ as CuS from $\mathrm{Cu}^{+2} \& \mathrm{Zn}^{+2}$ solution.
$\rightarrow \quad$ If $\mathrm{H}_{2} \mathrm{~S}_{(\mathrm{g})}$ is passed through a solution containing $\mathrm{Cu}^{+2}$ and $\mathrm{Zn}^{+2}$ after adding small quantity of HCl to the solution, only CuS precipitates,

ZnS does not precipitate. The degree of ionisation decreases in presence of HCl . i.e.

$\rightarrow$ The concentration of $\mathrm{S}^{2-}$ ions the solution becomes very low under the influence of common ion $\left(\mathrm{H}^{+}\right)$. As the solubility of CuS is very low compared to the solubility of $\mathrm{ZnS}\left(\mathrm{K}_{\text {sp(Cus) }}<\mathrm{K}_{\mathrm{sp}(\mathrm{ZnS})}\right)$, only CuS precipitates by keeping very low concentration of $\mathrm{S}^{2-}$ ions.
$\leadsto$ 2. Precipitation of Gr. III A metal ions only using $\mathrm{NH}_{4} \mathrm{OH}+\mathrm{NH}_{4} \mathrm{Cl}$ [Oct.97)
$\rightarrow$ To precipitate hydroxides of only $\mathrm{Al}^{+3}, \mathrm{Fe}^{+2}, \mathrm{Fe}^{+3} \& \mathrm{Cr}^{+3}$ in Gr . III A of qualitative analysis, $\mathrm{NH}_{4} \mathrm{Cl}$ solution is added to the test solution before $\mathrm{NH}_{4} \mathrm{OH}$ solution. As a result the following equilibrium shifts in reverse direction due to common ion $\mathrm{NH}_{4}^{+}$(Le-chatelier's principle). This decreases the concentration of $\mathrm{OH}^{-}$to a large extent. As a result, the hydroxides of ions of Gr. III B, IV and $\mathrm{Mg}^{+2}$ do not precipitate in Gr. III A.

$$
\left.\begin{array}{ll}
\mathrm{NH}_{(4)} \mathrm{OH} & \mathrm{OH}^{-}+ \\
\mathrm{NH}_{4}^{+} \\
\mathrm{NH}_{(4)} \mathrm{Cl} & \mathrm{Cl}^{-}+ \\
\mathrm{NH}_{4}^{+}
\end{array}\right) \text {Common ions }
$$

$\rightarrow$ As the solubilities of hydroxides of Gr. III A are very low, only hydroxides of Gr . III A precipitate by $\mathrm{NH}_{4} \mathrm{OH}$ in the presence of $\mathrm{NH}_{4} \mathrm{Cl}$.
